

As an Independent Connections Provider (ICP), we design and build electrical infrastructure solutions across the UK, bringing high voltage power to the places it's needed, helping our customers to grow their business operations. We're also on a mission to decarbonise built Britain, driving the expansion of EV charging and onsite power generation.

Bringing you high voltage connections

We specialise in the design and installation of new high voltage electricity supplies.

We are fully accredited and licenced to provide critical power supply infrastructure, connecting your buildings to the electricity distribution network.

Our team of expert electrical engineers install the substations and cables required to distribute electricity from the power network to where it is needed, whether that be commercial, industrial or residential apartments.

Get your fleet and workplace ready for Electric Vehicles (EV)

The rapid expansion of EV charging infrastructure is needed to keep up with the uptake of electric vehicles and fleet decarbonisation and we are helping drive that expansion, connecting super hubs and ultra-rapid charging stations across the UK.

We can offer an end-to-end service, managing both the DNO connection as well as the EV charging hub, meaning we can design and install substations, transformers, the Low Voltage network, SCADA communications and all civils.

Supporting your building expansion and new developments

We offer a full design and installation service for electrical connections to apartment developments and mixed-use developments where individually metered supplies are required.

We provide the electrical connection to the building, the internal Low Voltage mains or both.

As a NICEIC approved contractor, we can also design and install the internal Low Voltage mains, with meters situated within either a communal meter cupboard or each apartment.

Replace your transformers for instant savings

We specialise in the design and installation of new high voltage electricity supplies.

We are fully accredited and licenced to provide critical power supply infrastructure, connecting your buildings to the electricity distribution network.
